1. According to the Lewis definition of acid-base reactivity, which of the following statements correctly defines a Lewis acid?
- a. A chemical species that donates an unshared electron pair from a filled nonbonding orbital to form a coordinate covalent bond.
 - b. A chemical species that accepts an electron pair to form a new coordinate covalent bond using a vacant low-energy orbital.
 - c. Any chemical species bearing a net positive formal charge, such as the tetramethylammonium cation ($(\text{CH}_3)_4\text{N}^+$), regardless of valence octet occupancy.
 - d. A chemical species that increases the concentration of hydroxide ions (OH^-) when dissolved in an aqueous solvent medium.
 - e. A chemical species that donates a proton (H^+) via heterolytic cleavage of a polarized $\text{X} - \text{H}$ bond.
